Trucs à broder: <https://dev.laurent-malys.fr/harmono-bro/>

Infra PickUp

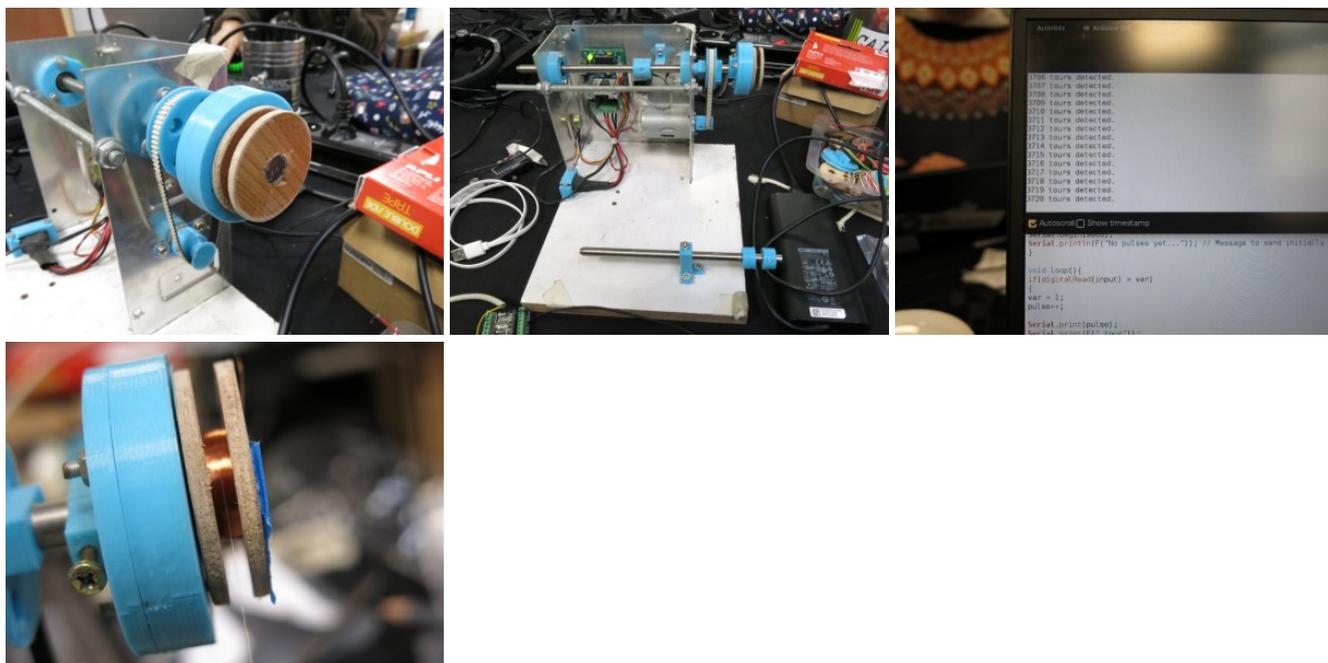

Profiter de ces beaux jours d'automne pour se chauffer au néons et ressortir la petite [bobineuse](#) pour créer un mirco

la base infrastructurelle

- Deux disques de cp plaqué de 3 mm découper à la scie cloche
- Un aimant Alnico de 10mm de diamètre
- Du fil enamel de 0,063mm de diamètre
- Une plaque rectangulaire pour insérer les œillets et fixer le câbles audio

le bobinage

- Un petit programme arduino pour compter les tour de bobines (grâce à un aimant placer sur l'axe de rotation et interrupteur reed)
 - récupérer ici : <https://forum.arduino.cc/t/simple-pulse-counter/519930>
- Environs 3500 tours

assemblage

- La bobine et la base sont collés à l'epoxy

trempage

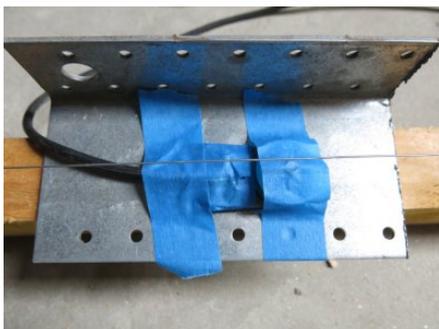

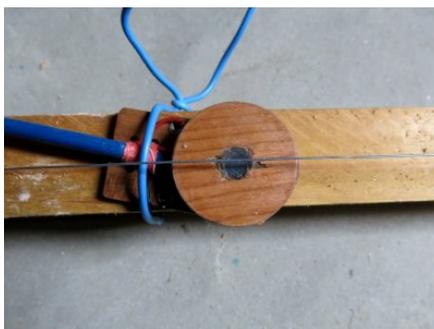

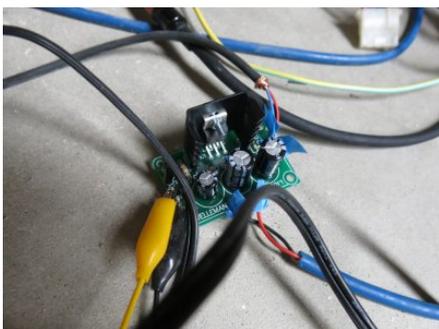

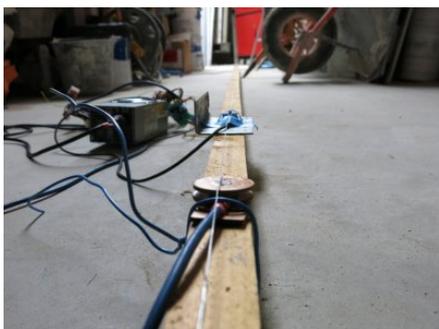

- Pour donner à l'ensemble un peu d'homogénéité et surtout protéger la bobine le tout est laissé trempé dans de la paraffine jusqu'à temps qu'il n'y ai plus de petites bulles

essai infrabassique avec retour d'informations

- Ça fonctionne plutôt bien au niveau des infras
- Ajout d'un second micro (caché sous le scotch bleu)
- Câblage du gros micro et du petit avec un ampli mono 7W pour créer un feedback de résonances

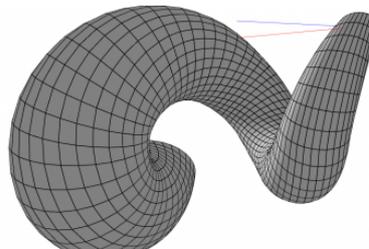

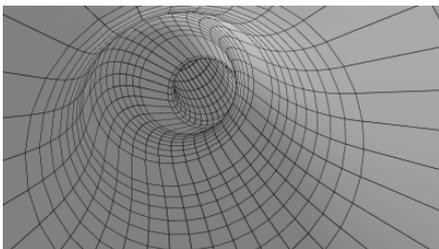

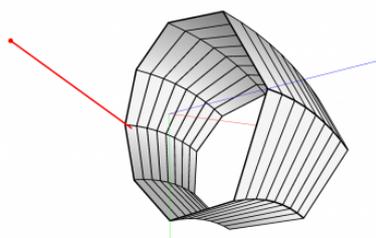

Infra graphique

Dérive dans les images semi-graphiques. Avant le graphisme «hi-res». Journal : infra-graphique

Quaternion

Exploration des quaternions et de la modélisation procedurale avec Processing

Les sketches Processing ci-dessous dépendent de façon importante sur deux librairies non officielles:

- **QueasyCam** (modifié), pour la navigation dans l'espace en 3D → <https://github.com/gweltou/queasycam/tree/master/distribution/queasycam-6/download/>
- **LibAvatar**, pour l'intégration des classes de LibGDX dans Processing → <https://github.com/gweltou/Processing-libAvatar/blob/2.0/distribution/libAvatar-3/download/libAvatar.zip>

Vous pouvez naviguer dans l'espace 3D avec les touches ZQSDA et E. Affichage en mode filaire avec W.
