

# INFRA

## Infra-Documentation (ExSitu)

Test de l'outil Multitude fraîchement développé par Laurent et permettant de collecter du son directement depuis une appli web, de l'archiver et de le rediffuser.

Le résultat sur 4 jours de résidence : <https://multitude.exsitu.xyz/v/visu/1931309934af589f4>

Démonstration de la diffusion sur 7 enceintes :

Gitlab : <https://gitlab.com/losylam/multitude>

## Laurent

Trucheteries : pour faire des trucheteries au plotter ou à la brodeuse, il faut joindre des chemins disjoints avec vpype :

```
vpype read truchet_094.svg linemerge linesimplify -t 0.05 write truchet_94_merge.svg
```

## Infrabuble

<https://dev.laurent-malys.fr/bacasable/infra/>

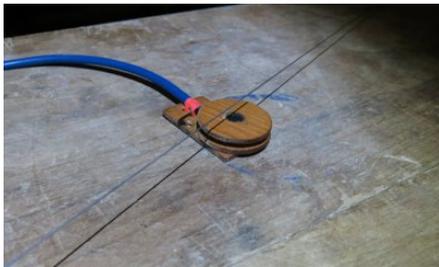

## Multitude

<https://multitude.labomedia.org/>  
<https://multitude.exsitu.xyz/v/map/19255da86d5b11f61>

## Dessins génératifs

Broderie + upcycling : [https://www.instagram.com/p/C58HraKiuYE/?img\\_index=1](https://www.instagram.com/p/C58HraKiuYE/?img_index=1)  
Trucs à broder: <https://dev.laurent-malys.fr/harmono-bro/>

## Infra PickUp

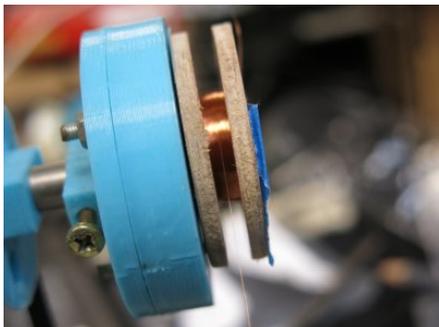

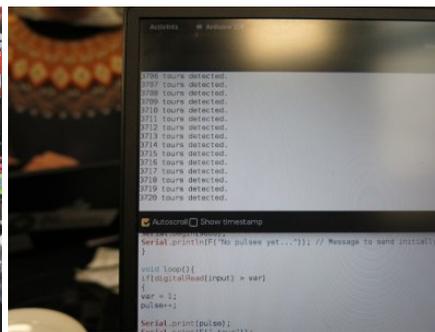

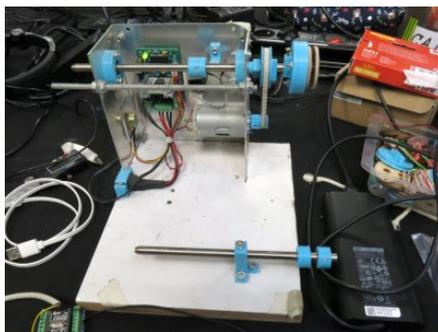

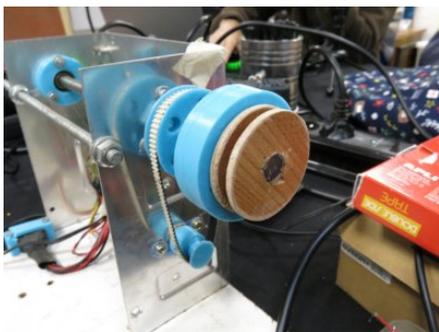

Profiter de ces beaux jours d'automne pour se chauffer au néons et ressortir la petite bobineuse pour créer un mirco

## la base infrastructurelle

- Deux disques de cp plaqué de 3 mm découper à la scie cloche
- Un aimant Alnico de 10mm de diamètre
- Du fil enamel de 0,063mm de diamètre
- Une plaque rectangulaire pour insérer les œillets et fixer le câbles audio

## le bobinage

- Un petit programme arduino pour compter les tour de bobines (grâce à un aimant placer sur l'axe de rotation et interrupteur reed)
  - récupérer ici : <https://forum.arduino.cc/t/simple-pulse-counter/519930>
- Environs 3500 tours

## assemblage

- La bobine et la base sont collés à l'epoxy

## trempage

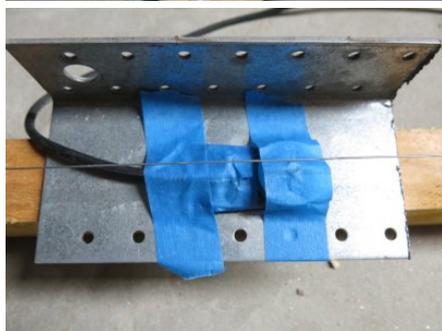

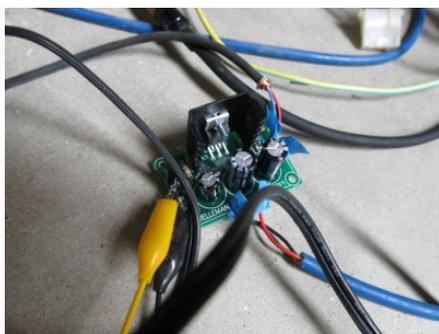

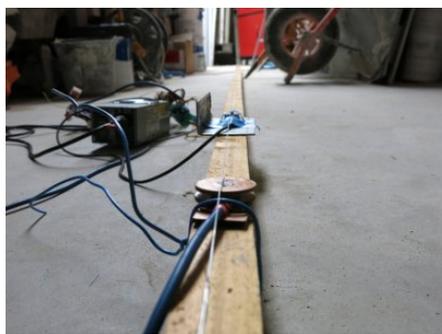

- Pour donner à l'ensemble un peu d'homogénéité et surtout protéger la bobine le tout est laissé trempé dans de la paraffine jusqu'à temps qu'il n'y ai plus de petites bulles

## essai infrabassique avec retour d'informations

- Ça fonctionne plutôt bien au niveau des infras
- Ajout d'un second micro (caché sous le scotch bleu)
- Câblage du gros micro et du petit avec un ampli mono 7W pour créer un feedback de résonances

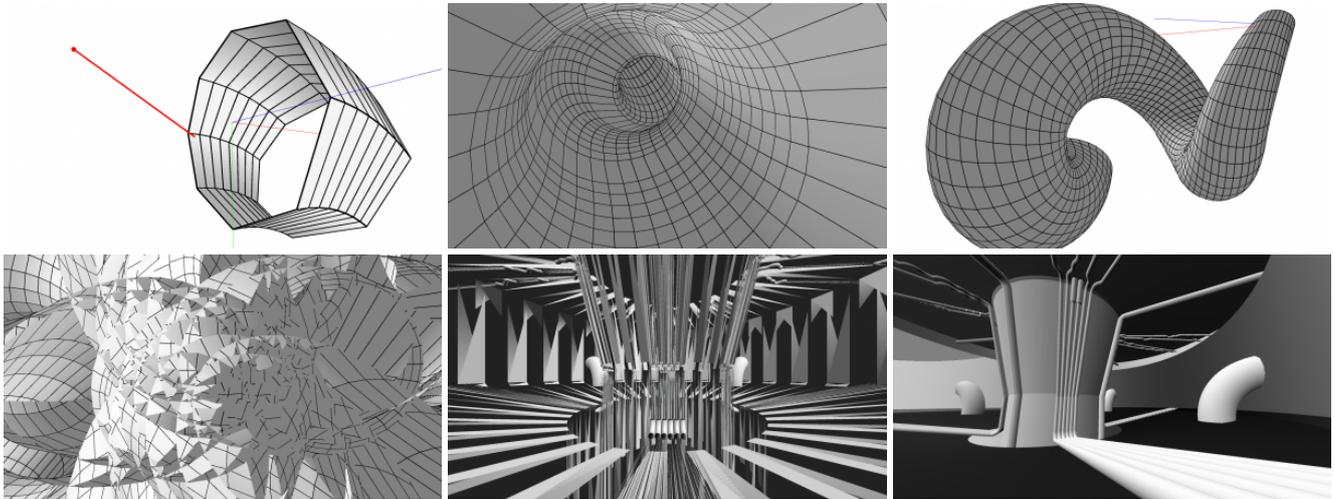

## Infra graphique

Dérive dans les images semi-graphiques. Avant le graphisme «hi-res». Journal : [infra-graphique](#)

# Quaternion

## Exploration des quaternions et de la modélisation procédurale avec Processing

Une vidéo qui m'a bien aidée à comprendre le ce truc : <https://www.youtube.com/watch?v=bKd2IPjI92c>

Les sketches Processing ci-dessous dépendent de façon importante sur deux librairies non officielles:

- **QueasyCam** (modifié), pour la navigation dans l'espace en 3D → <https://github.com/gwelto/queasycam/tree/master/distribution/queasycam-6/download/>
- **LibAvatar**, pour l'intégration des classes de LibGDX dans Processing → <https://github.com/gwelto/Processing-libAvatar/blob/2.0/distribution/libAvatar-3/download/libAvatar.zip>

Vous pouvez naviguer dans l'espace 3D avec les touches ZQSDA et E. Affichage en mode filaire avec W.
