Atelier Processing : typographie

Ressources de fonts à télécharger

- https://fonts.google.com
- https://fontawesome.com
- http://www.fontsaddict.com

Sous linux, c'est grace à la font “Noto Color Emoji”, installée par défaut, que l'on peut afficher des émojis dans diverses applications (dont le Terminal). Comme il n'est pas possible d'utiliser une font de couleur dans Processing on pourra utiliser “Noto Emoji” à la place https://fonts.google.com/noto/specimen/Noto+Emoji.

}
```

Utilisation

```
TextEffect te;
te = new TextFade("Hello", 100, 180).setFont("FreeMono Bold", 50);

void draw() {
  te.update();
}

TextEffect te = TextHScroll(String "Bonjour", 400, 2)
```

Types d'effets:

- TextFade(String text, int x, int y);
- TextHScroll(String text, int y, float speed);

Methodes de la classe TextEffect:

- setFont(String font, int size)
- setFont(PFont font)
- delay(float seconds)
- setText(String text)
- setPosition(float x, float y)
- setColor(int r, int g, int b)
- setColor(color c)
- reset()
